## Broad-band mHz QPOs and spectral study of LMC X-4 with AstroSat

*Tuesday, April 4, 2023 3:05 PM (15 minutes)*

LMC X-4 is a highly luminous and eclipsing high-mass X-ray binary pulsar which is known to exhibit variations in X-ray flux over a wide range of time scales. The Large Area X-ray Proportional Counter (LAXPC) and Soft X-ray Telescope (SXT) instruments onboard the *AstroSat* observed the source in August 2016. The source was found to emit an X-ray luminosity of  $\sim 2 \times 10^{38}$  erg s<sup>-1</sup> in the energy range of 0.5-25 keV. The power density spectrum showed the presence of coherent pulsations at 13.5 s along with a  $\sim 26$  mHz quasi-periodic oscillation feature. From the joint analysis of the SXT and LAXPC spectral data, the 0.5-25 keV spectra were found to be comprised of an absorbed high-energy cut-off power law with a photon index of  $\sim 0.8$  and cut-off at  $\sim 16$  keV, a soft thermal component with  $kT_{BB} \sim 0.14$  keV, and emission lines due to Fe K $\alpha$ , Ne IX, and Ne X. We will discuss the implications of these results.

### Presentation Type

Oral

**Primary author:** SHARMA, Rahul (Raman Research Institute)

**Co-authors:** Prof. JAIN, Chetana; Mr RIKAME, Ketan; Prof. PAUL, Biswajit

**Presenter:** SHARMA, Rahul (Raman Research Institute)

**Session Classification:** Neutron Stars

**Track Classification:** Neutron Stars
